

SMARTVOICEPLUS - RECEPTIONIST PHONE WITH SINGLE-LINE PHONES

SmartVoicePlus is a virtual VoIP phone system for up to 20 single line phones plus one 4-line receptionist phone per location. It includes BOTH the phone lines and the phone system functionality. All you add are the phones; no need to purchase an expensive phone system. SmartVoicePlus includes everything a small company needs to effectively manage their business communications.

How It's Setup

With SmartVoicePlus, one multi-line and multiple single-line analog phones are used together. This application is ideal for situations where a receptionist answers most calls for the business but each user requires their own phone number. The multi-line phone is used for the receptionist, allowing him or her to handle multiple calls independently. A hunt group automatically delivers the call to the receptionists' free line. Each additional phone receives its own phone number and extension number. Calls are easily transferred from the receptionist to the other phones.

Note: Multi-line receptionist phone is optional.
